

The Bat Egg

has collapsed!

We were very proud of our beautiful bat egg. Built from waste stone to house a few different bat species with a special cave inside.

But I think the bats knew more than we did - they visited but never settled. And then the egg collapsed, first on one side and then the other, in the past year.

We are not planning to rebuild it but let it become a glorious ruin covered in wild flowers.

Pipistrelle bats weigh between 3.5 and 8.5 grams, but can eat up to 3,000 insects in a single night! They may be living in the crevices of the bat egg.

Stone carver, Tom Clark, built the bat egg, finishing in December 2021.
